Notification Engine

Assessment Summary

Choosing the platform that delivers operational notifications to Jewson customers — and how it fits STARK UK's landscape.

Intellias | JEWSON

Requirements

Three channels, required

Push | **SMS** | **Email**

WhatsApp | RCS

Push reaches app users; SMS and email reach every customer. WhatsApp and RCS matter for growth, not for day one.

One hard boundary

The platform **delivers messages — nothing else**. Events and triggers stay in the STUK API Platform; marketing stays in Salesforce Marketing Cloud.

The non-negotiables

60 sec	Urgent notifications delivered within a minute (p95) — account restricted, order ready, payment overdue.
15 min	Routine notifications — balances, statements, reminders — within fifteen minutes of the scheduled run.
99.9%	Monthly availability, committed in the contract — not offered as best effort.
No dupes	At-least-once delivery with no duplicate the customer ever sees, so STUK can retry safely.
UK / EU	Message content and contact details processed in the UK or EU.

Selection methodology – how the field was narrowed

1

Gartner Leaders

The five Leaders of Gartner's CPaaS Magic Quadrant (May 2026) taken as the field.

→

2

Push Notifications filter

Push Notifications are required — but Gartner treats it as **optional for this market**.

→

3

Meet the bar

Three platforms were assessed in depth against the requirements.

Evidence discipline: every capability is credited from the vendor's own documentation as published in September 2026 — never from marketing material — and generally-available products are strictly separated from betas, which sit outside support terms and availability commitments.

Gartner Magic Quadrant — CPaaS

Highlights

- **Five Leaders** — Twilio, Infobip, Sinch, Vonage and Proximus Global form the assessment field.
- **A deliberate maturity bar** — vendors outside the Leaders quadrant were not assessed for a platform carrying financial messages.

How the field was narrowed – summary

1

Gartner Leaders

The five Leaders of Gartner's CPaaS Magic Quadrant (May 2026) taken as the field.

Twilio | Infobip | Sinch | Vonage | Proximus

2

Push Notifications filter

Push Notifications are required — but Gartner treats it as **optional for this market**. Two Leaders offer no push channel at all and drop out.

Twilio | **Infobip** | **Sinch** | ~~Vonage~~ | ~~Proximus~~

3

Meet the bar

Three platforms assessed in depth. **Twilio and Infobip** meet the requirements, each with one significant condition. Sinch does not, today.

Twilio | **Infobip** | ~~Sinch~~

Measured against the requirements

Requirement	Twilio	Infobip	Sinch
Push, SMS & email offered	! push in private beta	! push generally available; only as part of a SaaS product	✗ push in closed beta
Fallback across push, SMS & email	✗ SMS / RCS / WhatsApp only	✓ one request, OMNI failover	! push + SMS; email outside
Marketing Cloud connector	✗ None from Twilio	! SMS and messaging apps – not push or email	! SMS and messaging apps. Push not documented; email not included (separate product)
99.9% availability, contracted	! 99.95% published — push excluded	! nothing published — negotiate	! 99.95%, best-effort basis
UK or EU data processing	✓ EU — no UK region	✓ UK for push & SMS	✓ EU only

✓ Meets the requirement ! Meets it with a condition ✗ Does not meet it

Strengths and trade-offs, side by side

Twilio

Right architecture, immature push

+ Only push API that takes device tokens directly — no vendor SDK in the Jewson app
+ Mature SMS & email; 99.95% SLA with service credits

– Push in private beta — outside SLA and support, no GA date
– Three separate products, three APIs and credential sets
– No fallback across push, SMS and email; no UK region

Infobip

Right product, wrong packaging

+ Only generally-available push among the Leaders
+ One platform — push, SMS and email fall back in a single request
+ UK processing for push & SMS; delivery time windows

– Push sold only inside a SaaS bundle (Moments / Conversations / Answers) — paying for what isn't needed
– Requires Infobip's SDK in the Jewson app
– No published availability commitment

Sinch

Out — for now

+ Clearest technical documentation of the three
+ Push and SMS fall back to one another; email at 99.99% with credits

– Push in closed beta, no GA date
– SDK takes over the app's push handling
– Email on a separate product, outside the fallback; EU only

Extra step – adding the Challenger: Cisco Webex Connect

Why an extra step: push is optional in Gartner's definition of CPaaS, so we looked one quadrant beyond the Leaders. Cisco moved from Visionary to Challenger in May 2026 and is the strongest fit outside the Leaders.

Measured against the requirements

Same criteria as the Leaders on slide 7

Push, SMS & email offered	✓	push generally available; SMS and email on the same platform
Fallback across push, SMS & email	!	built in flows that branch on error or timeout — confirm push failure signals
Marketing Cloud connector	✗	None
99.9% availability, contracted	✓	Gold SLA 99.95%, 15-min P1 response (Standard is 99.5%)
UK or EU data processing	✓	UK tenant, hosted in AWS London

✓ Meets the requirement ! Meets it with a condition ✗ Does not meet it

Cisco Webex Connect

Complete product, SDK in the app

+ Generally available push, SMS and email on one platform
+ UK hosting — tenants can run in AWS London
+ Contracted availability: 99.95% on the Gold SLA, with 15-minute P1 response
+ Fallback orchestrated inside the platform, in visual flows

– Requires the Webex Connect SDK in the Jewson app — the same issue as Infobip
– Licensed by edition through Cisco, with usage entitlements and overage
– Email route (AWS SES or SMTP) and duplicate protection to confirm with Cisco

Source: Cisco documentation, Oct 2026; Gartner MQ CPaaS, May 2026

Verdict – Three contenders. One caveat each.

Gartner Leader

Twilio

The caveat: Push notifications are available in beta version

Gartner Leader

Infobip

The caveat: Push notification is part of another Infobip Saas Product and needs to be purchased separately

Gartner Challenger

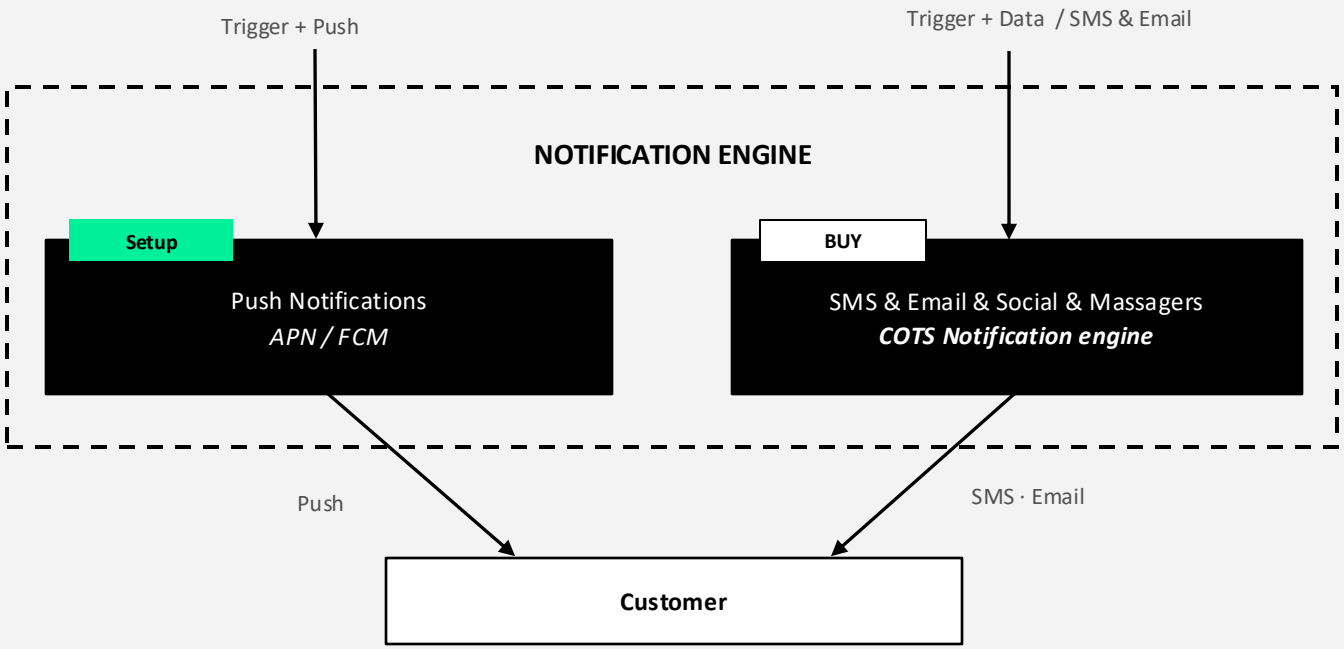

Cisco Webex Connect

The caveat: No Salesforce Marketing Cloud connector

Proposed next steps

1. **Contact three ISV**
2. **Run three working sessions**
3. **Price and prove one platform**

Alternative option – select an engine, but build bespoke push

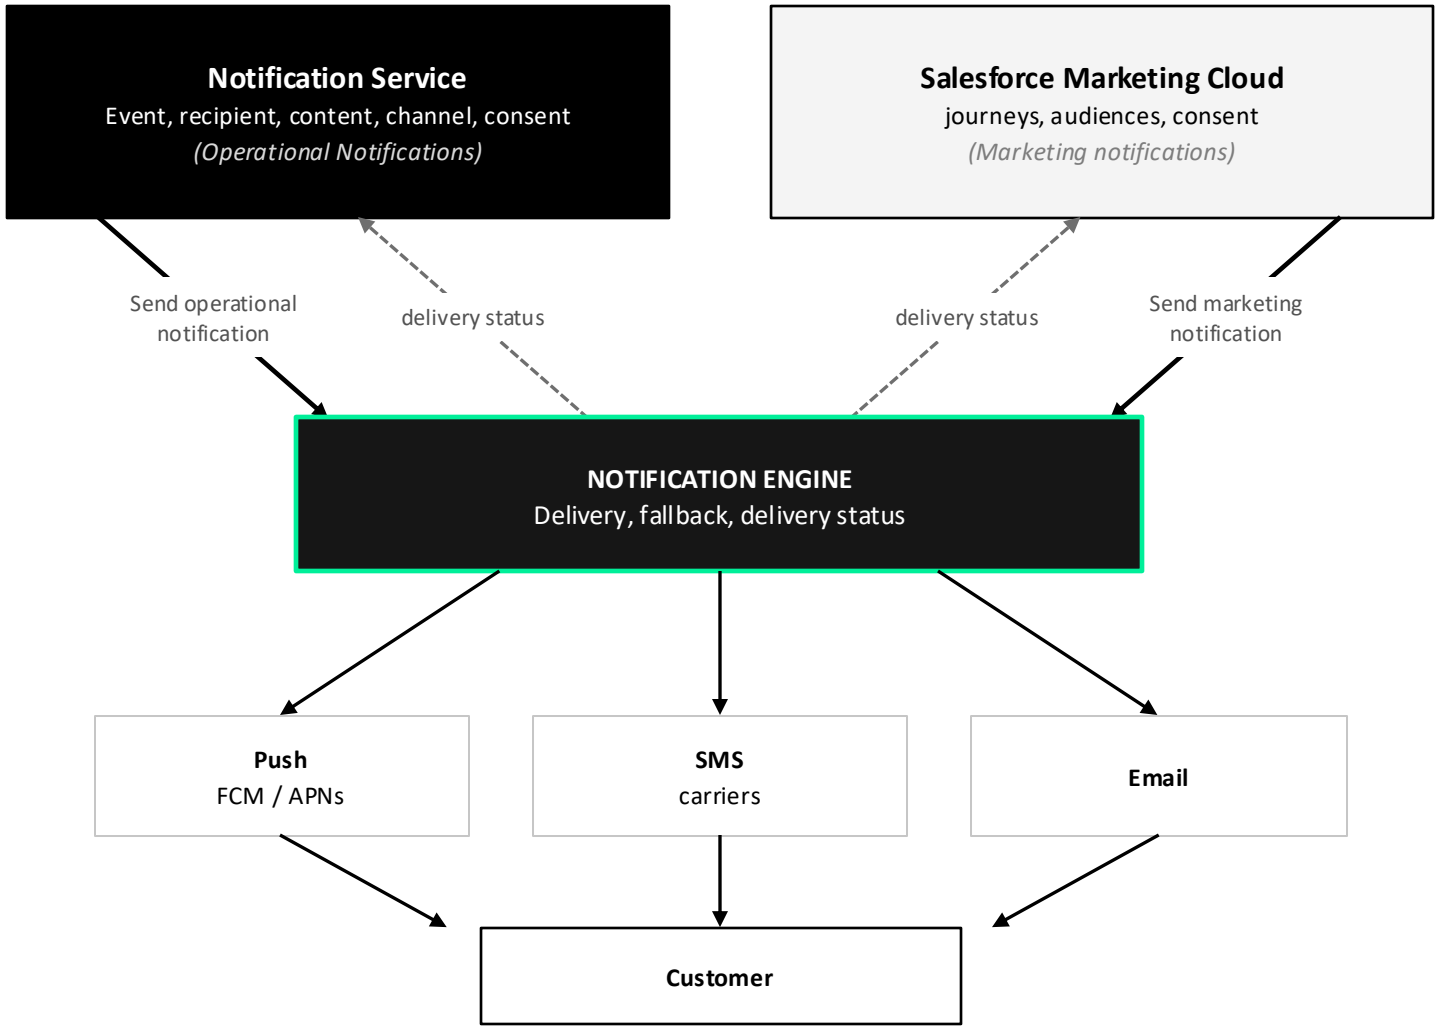

Highlights

No beta, no bundle — but a build

+ The best from both worlds – fast bespoke push notifications and Leading Notification engine
+ Ability to select the most suitable and affordable COTS Notification engine

– **Bespoke Push notification will required Efford to implement and future support**

Proposed solution architecture

Highlights

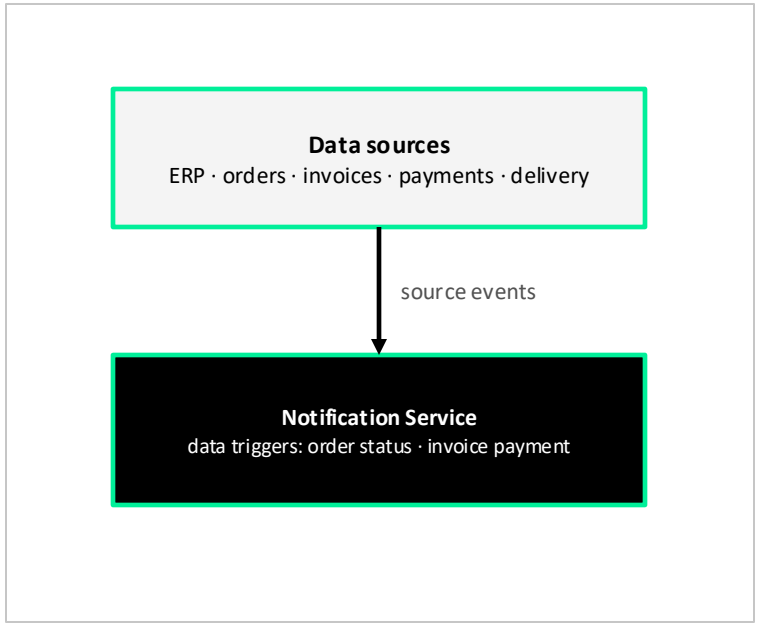

- **One front door** — the STUK API Platform detects the event and decides recipient, content, channel and consent; the platform only delivers.
- **Clean split from marketing** — SFMC keeps journeys, audiences and content; operational and marketing traffic never mix.
- **Fallback inside the platform** — push falls back to SMS or email within a single request when a device is unreachable.
- **Status flows back** — delivery receipts return to STUK and SFMC for audit, retries and suppression.
- **One integration, every system** — any STARK UK system sends through the same platform API.

Intellias | JEWSON

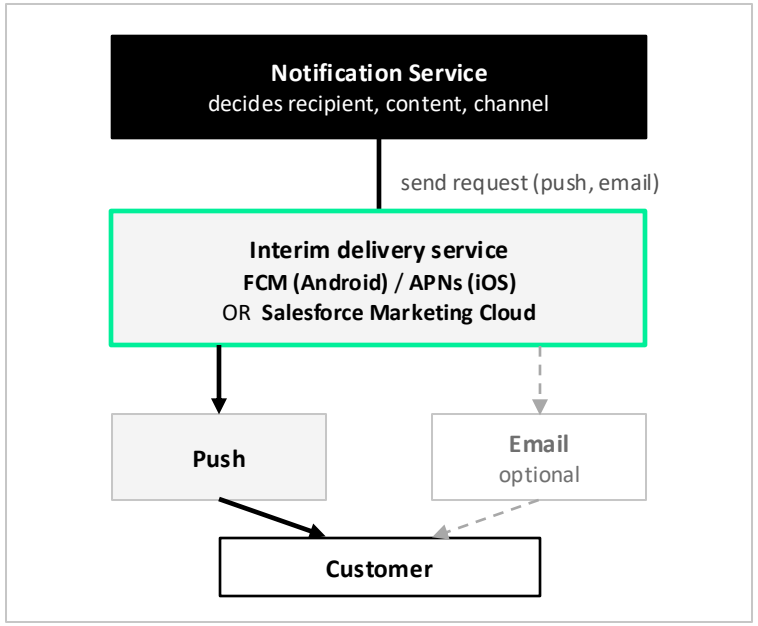

Legend: ■ New Components □ Existing

2 Phase Roadmap

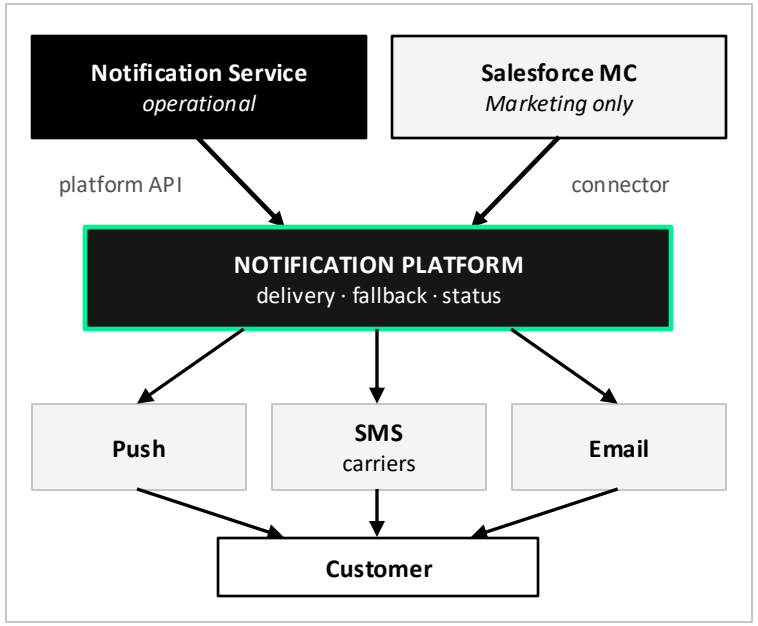

PHASE 1 Event data foundation → **PHASE 1.1** Mobile Push Notifications (Optional) → **PHASE 2** Full Solution

- **Data sources connected** — order, invoice, payment and delivery systems feed Notification Service
- **Data triggers built** — source changes become events: order status, invoice payment.
- **No platform yet** — nothing reaches customers until Phase 2.

- **Interim delivery** — push goes through Salesforce MC, or directly via APNs and Firebase.
- **Email optional** — sent through SFMC only if needed in this phase.
- **Outcome** —customers get push notifications about order and invoice updates before new infrastructure exists.

- **New platform delivers** — push, SMS and email, with fallback and delivery status.
- **SFMC back to marketing** — journeys, audiences and content only, fed in via connector.
- **Outcome** — the target architecture from the previous slide.

Three routes to the full notification platform

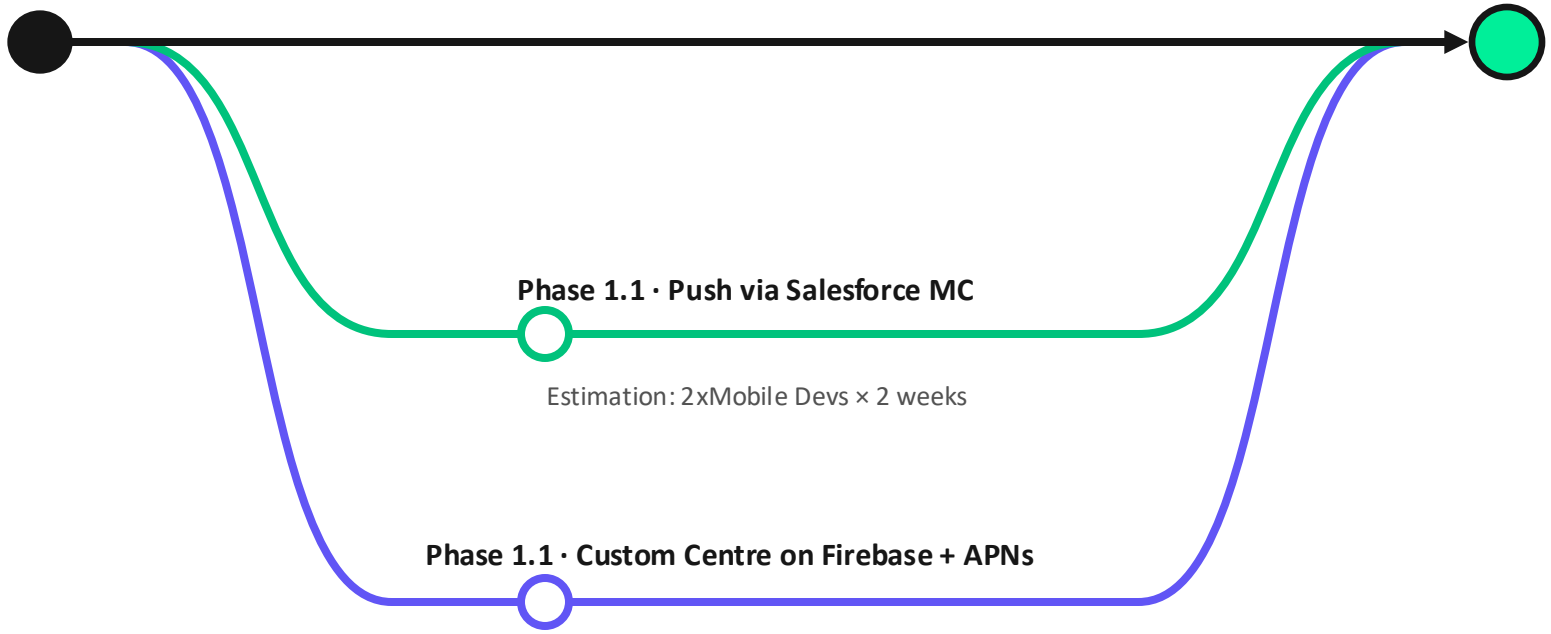

Route 1
Lowest cost
Slowest to first results

Route 2
Fastest to market
Depends on Salesforce

Route 3
Salesforce-independent
Highest extra cost

Phase 1 · Data + triggers
Estimation:
- Data: TBD
- Notification Service: 2xBE × 2 months

Phase 2 · Full engine
Estimation:
- Notification Engine Setup: **TBD**
- App Integration: 2xMobile Devs × 2 weeks

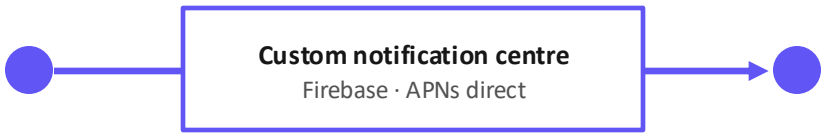

Phase 1.1 · Push via Salesforce MC

Estimation: 2xMobile Devs × 2 weeks

Phase 1.1 · Custom Centre on Firebase + APNs

Estimation:
- 2xMobile Devs × 2 weeks
- 1xBE x 2 months

Three routes side by side

Route	Phase 1 Data + triggers	Phase 1.1 Interim push	Phase 2 Full engine	Extra effort on top of base	First results time to market	Salesforce dependency
Route 1 Lowest cost				**None** base phases only	**Slowest** waits for full engine	**Independent** no interim sender
Route 2 Fastest to market				**+2 mobile × 2 wks** repeated when full engine is integrated	**Fastest** push live in Phase 1.1	**Dependent** SFMC sends push
Route 3 SF-independent				**+2 mobile × 2 wks** +1 BE × 2 months · highest extra cost	**Medium** after ~2-month BE build	**Independent** own centre
